**CERTIFICATE FOR**  
**QC LOAM SOIL B**  
**TRACE ELEMENTS/METALS IN SOIL**

**BATCH:** VKI-20-3-0109

**INSTRUCTIONS FOR USE OF THE REFERENCE MATERIAL**

**Description**

This reference material consists of dried soil. The certificate includes documentation for the analytical parameters As, Cd, Cr, Cu, Hg, Ni, Pb, Zn, K and loss on ignition.

**Use**

The reference material is intended for quality control, i.e. measurement and control of the trueness and precision of analyses. It is typically intended for analyses of trace elements/metals and loss on ignition in soil. It may also be used for the validation of analytical methods. It is important that the batch numbers of the reference material and on the certificate are identical.

**Preparation for Use**

Digest samples for determination of trace elements/metals. The material is hygroscopic. It is therefore recommended to determine the content of dry matter at regular intervals.

**Analysis**

For quality control the reference material is analysed at the same time and in the same manner as other samples.

**Storage and Durability**

Store the reference material protected from sunlight at room temperature in the original brown glass container. Keep the container tightly closed. The certificate is valid until **1st of September 2027** provided the material is stored under the recommended conditions.

**PRODUCTION OF THE REFERENCE MATERIAL AND DOCUMENTATION**

**Production**

The reference material is contaminated soil. Stones and plant material was removed. The soil was dried at approximately 100 °C, crushed and sieved to < 90 µm, and homogenised again. The material was sterilised by γ-irradiation. The production of this reference material is in accordance with the quality management procedures of Eurofins, with the aim of obtaining the intended quality of the material.

## **Documentation of Content**

Documentation of the reference material's content of trace elements/metals is based on measurements in digested samples. The measured concentrations are calculated on the basis of dry matter.

### **Internal control**

The analytical quality of Eurofins has been documented and found satisfactory by regular participation in international proficiency tests.

### **Homogeneity:**

The homogeneity has been investigated by measurements of all certified trace elements/metals in randomly selected containers of QC Loam Soil B. Tests for homogeneity have been performed by comparing the standard deviation between the reference material units with the within batch standard deviation obtained from triplicate measurements of the reference material in the same container (F-test, 95 %). In addition, homogeneity was followed up in accordance with ISO Guide 35 /1/ for all parameters as a part of the external control. No indication of heterogeneity was found except for Pb in the external control. The difference may be attributed to variation between laboratories and not between samples.

### **Stability:**

The stability of the reference material is being followed by regular analyses of As and Hg in reference materials stored at 20 °C and 4 °C, and no indication of instability was observed at the date of this certificate.

### **External documentation**

The external laboratory documentation was performed by selected Nordic and German laboratories. The laboratories were requested to analyse two containers of QC Loam Soil B: both containers as duplicate determinations in the same analytical series, followed by analysis of the containers in two different analytical series as single determinations. In addition, the laboratories were requested to analyse a control sample (soil) sent together with the reference material. The statistics are in accordance with the international standard: ISO Guide 35 /1/. On the basis of the analytical results submitted by the laboratories the following statistical parameters have been calculated:

$y_{char}$ : average, calculated in accordance with ISO Guide 35 (section A.2.4.)

$s(y)$ : standard deviation between the laboratories, calculated in accordance with ISO Guide 35 (section A.2.5.):

$$\sqrt{\frac{\sum (y_i - y_{char})^2}{p-1}}$$

The 95 % confidence interval of the true mean value of analytical results is:

$$y_{char} \pm t_{0,025}(v) \cdot \frac{s(y)}{\sqrt{p}}$$

where

p: number of laboratories included in calculations

v: p-1, degrees of freedom

$t_{0,025}(v)$ : t value of 0,025 level at v degrees of freedom.

The certification for trace elements/metals is based on measurements for samples digested with 7 N nitric acid in microwave oven or autoclave. All methods are included in the certified value for loss on ignition.

Digestion in autoclave or microwave oven gives no significant difference for Cd, Cu, Hg, Pb and K. Certified values are therefore based on the combined results for both procedures.

For As, Cr, Ni and Zn the results after digestion in autoclave or microwave oven were significantly different. The number of laboratories using digestion in microwave oven was too small to allow estimation of a certified value, but for Cr, Ni and Zn an indicative value is given. Only three non-excluded laboratories used digestion in microwave oven for As and the certificate therefore has no information for this procedure.

The certified values are based on results from selected laboratories. The criteria for selection of laboratories were that the laboratories perform the analyses on a routine basis. Furthermore, the laboratories were selected on the basis of their results in proficiency tests and earlier certifications.

The criteria for selection of laboratories from Denmark, Germany, Norway and Sweden were as follows:

- the laboratory results in the proficiency tests gave z-scores below 2 (absolute values), and
- the laboratory analyses more than 20 analytical series each year or holds accreditation for the parameter.

For Finnish laboratories the Finnish Reference Laboratory has identified the laboratory as qualified.

The criteria for selection of laboratory results for the certification were:

- the laboratory result for the control sample in the certification deviated less than 25 % from the nominal value, and
- the laboratory results in the certification are not Cochran or Grubbs outliers.

The data included in the external documentation and names of the participating laboratories are listed in an annex to this certificate. On the basis of the selected results, the following has been calculated:

#### Certified Values

DETERMINAND	UNIT	AVERAGE $y_{char}$	BETWEEN LABORATORY STANDARD DEVIATION $s(y)$	95 % CONFIDENCE LIMITS OF THE AVERAGE VALUE $y_{char} \pm t_{0,025}(v) \cdot \frac{s(y)}{\sqrt{p}}$		NUMBER OF DATA SETS IN CALCULATIONS/ METHOD (p)	EXCLUDED DATA SETS C: Cochran outlier G: Grubbs outlier
				Lower	Upper

\*: Values in brackets are indicative.

## Methods

- A Atomic absorption spectrometry with graphite furnace (ETAAS), e.g. ISO 11047
- B Atomic absorption spectrometry with flame (FAAS), e.g. ISO 11047
- C Atomic absorption spectrometry with hydride technique (HAAS), e.g. ISO 16772 (Hg), ISO 20280 (As)
- D Inductively coupled plasma atomic emission spectrometry (ICP-AES), e.g. ISO 22036
- E Inductively coupled plasma mass spectrometry (ICP-MS)

## Use of the Certified Values

For laboratories with an analytical quality that is comparable with that of the laboratories who have contributed to the external documentation of this certificate, the following applies:

- 1) For single determinations, analytical results will with a probability of 95 % be in the interval:

$$y_{char} \pm t_{0,025}(v) \cdot \frac{s(y)}{\sqrt{p}}$$

- 2) Analytical results, calculated as the average of two determinations will with a probability of 95 % be in the interval:

$$y_{char} \pm t_{0,025}(v) \cdot \frac{s(y)}{\sqrt{p}}$$
